Parallel Programming for Exascale

Jean-Marc GRATIEN1

¹Department of Computer Science IFP New Energy

November 7th, 2022 / Master Data-HPCAI

Outline I

- Introduction
 - Exascale
- Parallel Architecture
 - Hardware Architecture
 - Memory Architecture
 - Trend in hardware design
- Parallel Programming Models
 - Programming Models
 - Algorithm Models
 - Parallel Random Access Machines
- Designing Parallel Programs
 - Parallel Design Pattern
 - Partitioning techniques
 - Parallel issues

Outline II

- Message Passing Programming
 - Introduction to MPI Programming
 - MPI Concepts
 - MPI, Data partition, Domain partition
- Task Programming
 - Introduction to Task Programming
 - Task Programming with since C++11
 - Task Programming with OpenMP
 - Task Programming with TBB
 - Task Programming: other Runtime System Tools
- Parallelism at instruction level
 - SIMD with OpenMP
- Parallel programming on heterogeneous architecture with SYCL
 - Parallelization with SYCL

Introduction
Parallel Architecture
Parallel Programming Models
Designing Parallel Programs
Message Passing Programming
Task Programming
Parallelism at instruction level
erogeneous architecture with SYCL

Outline III

Exascale

Objectifs

Objectifs

- General Overview on Parallel Programming
- Introduce to tools for Exascale programming
- Introduction on Programming and Hardware Models
- Focus on various Parallel Programming for Shared Memory architecture:
 - Parallelization with pragma
 - Task Programming, DataFlow Programming
- Application : OpenMP, TBB, std::threads

Audience and Prerequisites

- Audience : computer science students
- Prerequisites :
 - sequential programming in C++
 - elementary algebraic math level (matrix vector operations)
 - image processing
- Material(Slide+TPs) available at :

https://drive.google.com/open?id=1HRx6qPRVYckY8H7KMdAcADWpI9iB-b19 git clone https://github.com/jgratien/ParallelProgrammingCourse.git

Introduction Parallel Architecture

Exascale

Exascale Challenge

Exascale Challenge

- What is the Exascale Challenge?
- Why?
- How?

Exascale Challenge

What is the challenge

Exascale Challenge

- goal in 2008 :
 - top machines reach PetaPLOPS (10¹⁵ FLOPS)
 - by 2018, design computing systems capable of at least one exaFLOPS (10¹⁸ flops)
- current state 14 years later :
 - EU: Frontier, Oak Ridge National Laboratory, 1.1 exaflop, HPE Cray system, AMD Epyc processor
 - Japon: 2020, 442 petaflops, Fugaku powered by Fujitsu's 48-core A64FX (ARM)
 - China: 2018, 2 fastest computers in the world. First exascale computer, chiness one, will enter service by 2020 (school of computing at the National University of Defense Technology (NUDT)))
 - (USA) The Exascale Computing Project hopes to build an exascale computer by 2021;

Exascale Challenge?

Why such challenge

Why Exascale Challenge? HPC resarch had in the past a real impact every body life In 2008, the exascale challenge was plan to:

- improve national economic competitveness;
- advance scientific discovery;
- stengthen national security;

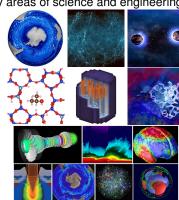

Exascale

Task Programming
Parallelism at instruction level
Parallel programming on heterogeneous architecture with SYCL
TP

Why the Exascale Challenge?

Historically, HPC had an impact on many areas of science and engineering:

- Atmosphere, Farth, Environment
- Physics applied, nuclear, particle, condensed matter, high pressure, fusion, photonics Bioscience, Biotechnology, Genetics
- Chemistry, Molecular Sciences
- Geology, Seismology
- Mechanical Engineering from prosthetics to spacecraft
- Electrical Engineering, Circuit Design,
 Microelectronics
- Computer Science, Mathematics
- Defense, Weapons
- Cosmology, Astropphysics
- •

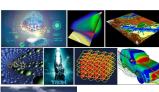

Exascale

Why the Exascale Challenge?

Nowadays, Industrial and Commercial

- "Big Data", databases, data mining
- Artificial Intelligence (AI)
- Web search engines, web based business services
- Medical imaging and diagnosis
- Pharmaceutical design
- Financial and economic modeling
- Management of national and multi-national corporations
- Advanced graphics and virtual reality, particularly in the entertainment
- industry Networked video and multi-media technologies
- Oil exploration
- Wind Energy

Roadmap fo Exascale

Various initiatives to achieve

- USA: Exascale Computing Project
- China: national plan for the next generation of high performance computers
- Europe: The CRESTA project (Collaborative Research into Exascale Systemware, Tools and Applications), the DEEP project (Dynamical ExaScale Entry Platform), and the project Mont-Blanc.[36] A major European project based on exascale transition is the MaX (Materials at the Exascale) project.
- Japon :

Exascale Challenge

Main issues to overcome

- Energy consumption reduction
 - impact on hardware design
 - heterogeneity (Computing Unit, Memory Units)
- trend on hardware design
 - impact on software design
 - lack of consensus
- Complexity management
 - software co-design
 - programming environment
 - abstractions, framework, layer architectures

Introduction

Memory Architecture

Shared Memory

Ability for all processors to access all memory as global address space.

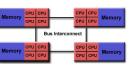

Classification:

- UMA : Uniform Memory Access
- NUMA : Non Uniform Access

Advantages:

- Global address space;
- Data sharing between tasks;

Disavantages:

- lack of scalability between memory and CPUs;
- synchronisation management;

Hardware Architecture Memory Architecture Trend in hardware desig

Memory Architecture

Distributed Memory

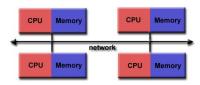

Require a communication network to connect inter-processor memory Local memory address

Advantages:

- Memory scalable with the number of processor;
- Rapid access to local memory;

Disavantages:

- requires communication;
- lack of global address space;
- non uniform memory access time.

Memory Architecture

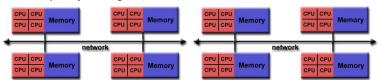

Hybrid Distributed-Shared Memory

Advantages:

advantage of both systems;

Disavantages:

complexity management;

Trend in hardware design

Heterogeneity

- Multi-scale process unit
 - VPU,Cores, processors, GP-GPU, acceleratos
 - various performance (enegy,speed,...)
 - need to manage load balancing
- Multi-scale memory unit
 - remote memory
 - multi-level local memory (cache L1,L2,L3,...), DRAM
 - Example : Latence (Core i7 Xeon 5500)

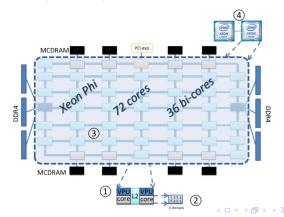

L1 CACHE hit	simeq 4 cycles	(2.1 - 1.2 ns)
L2 CACHE hit	\simeq 10 cycles	(5.3 - 3.0 ns)
L3 CACHE hit unshared line	\simeq 40 cycles	(21.4 - 12.0 ns)
L3 CACHE hit shared line in another core	\simeq 65 cycles	(34.8 - 19.5 ns)
L3 CACHE hit modified by another core	\simeq 65 cycles	(34.8 - 19.5 ns)
local DRAM	\simeq 60 ns	
remote DRAM	\simeq 100 ns	

need to manage coherency, synchronization, data movement

Trend in hardware design

Heterogeneity

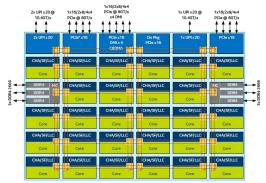

Examples: Intel Knight Landing micro-architecture

Trend in hardware design

Heterogeneity

Examples: Intel Skylake Xeon micro-architecture

CHA – Caching and Home Agent; SF – Snoop Filter; LLC – Last Level Cache; Core – Skylake-SP Core; UPI – Intel® UltraPath Interconnect

Shared memory model

Programming Models

Algorithm Models
Parallel Random Access Machines

Parallel Programming Models

Parallel programming on heterogeneous architecture with SYCL

Threads model

Type of shared memory programming

A single "heavy weight" process can have multiple "light weight", concurrent execution paths

Implementation:

- POSIX Threads
 - Specified by the IEEE POSIX 1003.1c standard (1995). C Language only. Part of Unix/Linux operating systems Library based Commonly referred to as Pthreads. Very explicit parallelism; requires significant programmer attention to detail.
- OpenMP
 - Industry standard, jointly defined and endorsed by a group of major computer hardware and software vendors, organizations and individuals.

 Compiler directive based Portable / multi-platform, including Unix and Windows platforms Available in C/C++ and Fortran implementations Can be very easy and simple to use provides for "incremental parallelism". Can begin with serial code.
- Microsoft threads
- Java, Python threads
- CUDA threads for GPUs

Programming Models

- PVM Parallel Virtual Machine

Programming Models
Algorithm Models
Parallel Random Access Machine

Parallel Programming Models

Data Parallel Model

Partitioned Global Address Space (PGAS) model :

- Global adress space
- Data set are organized in vommon data structures

Current implementations:

- Coarray Fortran: a small set of extensions to Fortran 95 for SPMD parallel programming. Compiler dependent.
- Unified Parallel C (UPC): an extension to the C programming language for SPMD parallel programming. Compiler dependent.
- Global Arrays: provides a shared memory style programming environment in the context of distributed array data structures. Public domain library with C and Fortran77 bindings.
- X10: a PGAS based parallel programming language being developed by IBM at the Thomas J. Watson Research Center.
- Chapel: an open source parallel programming language project being

Parallel Random Access Machines

Here, n number of processors can perform independent operations on n number of data in a particular unit of time. This may result in simultaneous access of same memory location by different processors.

To solve this problem, the following constraints have been enforced on PRAM model

- Exclusive Read Exclusive Write (EREW) Here no two processors are allowed to read from or write to the same memory location at the same time.
- Exclusive Read Concurrent Write (ERCW) Here no two processors are allowed to read from the same memory location at the same time, but are allowed to write to the same memory location at the same time.
- Concurrent Read Exclusive Write (CREW) Here all the processors are allowed to read from the same memory location at the same time, but are not allowed to write to the same memory location at the same time.
- Concurrent Read Concurrent Write (CRCW) All the processors are

Communication and Synchronization

- Communication overhead
- Latency vs Bandwith
- Visibility
- Synchronous vs Asynchronous
- Scope of communications
- Complexity

Data Dependencies

- Definition
- Data Flow
- Data movement
- ...

Load Balancing

- Impact on parallel efficiency (barrier, synchronization,...)
- How to improve Load Balance :
 - Data distribution : dynamic partitioner
 - Work distribution: task scheduler

Granularity

- Computation Communication Ratio
- Fine-grain Parallelism :
 - thread parallelism,SIMD, GP-GPU
 - easy for load balancing
 - low computation to communication ratio
- Coarse-grain Parallelism :
 - high computation to communication ratio rate
 - hard for load balancing

Multi-level parallelism

New heterogeneous architectures imply to combine Coarse and Fine Grained parallelism

- Coarse grain parallelism :
 - cluster, socket level
 - reduce communication
- Fine-grain Parallelism :
 - thread parallelism,SIMD, GP-GPU
 - easy for load balancing

Introduction to MPI Programming

 - Introduction to MPI Programming
 Jean-Mark GRATIEN

- 1992 1994 : New group to define a standard API to implement Message Passing libraries
- MPI Forum : http://www.mpi-forum.org
- Purpose :
 - define a standard ;
 - implementation issues are not taken into account;
 - provide tools that ensure portability on distributed memory architecture

MPI Programming

History

- MPI 1 (1994) :
 - first C and Fortran interface
- Since : several normes
 - MPI 2 (1997),
 - new datatype constructor, langage interoperability
 - new functionalities, One side communication, MPI IO, dynamic process
 - Fortran, C++ bindings
 - MPI 3 (2012)
 - One side communication, non blocking collective communications
 - MPI 4 to come ...
- Since : several implementations
 - MPICH, OpenMPI, MVAPICH, IntelMPI, ...

MPI Programming

MPI

- Message Passing Interface
- it is a library (not a language) with a standard API
- design to develop for distributed memory architecture
- based on a SPMD (Single Program Multiple Data) model
- a MPMD model is now available since MPI-2

MPI Programming

MPI Concepts : Communicator

MPI Communicator

MPI Communicator

MPI Comm comm;

- define a static group of MPI process
- all the processes are in the predifined group : MPI_COMM_WORLD
- to get number of MPI proces in a MPI group:

MPI Group size

int MPI_Comm_size(MPI_ comm, int* size);

• to get an a process id in a MPI group

MPI process rang

int MPI_Comm_rank(MPI_ comm, int* rank) ;

Introduction to MPI Programming MPI Concepts MPI, Data partition, Domain partition

MPI Programming

MPI Concepts: Data Types

Basic types

Dasio types	
MPI	С
MPI_CHAR	signed char
MPI_SHORT	signed short
MPI_INT	signed int
MPI_LONG	signed long
MPI_UNSIGNED_CHAR	unsigned char
MPI_UNSIGNED_SHORT	unsigned short
MPI_UNSIGNED_LONG	unsigned long
MPI_FLOAT	float
MPI_DOUBLE	double
MPI LONG DOUBLE	long double

MPI Concepts
MPI, Data partition, Domain partition

MPI Programming

MPI Concepts: Derived Data Types

Derived types constructed from existing types

```
Define new Data Type
```

```
MPI_Type_contiguous(count,oldtype,newtype);
MPI_Type_vector(count,blocklenght,stride,oldtype,newtype);
MPI_Type_struct;
```

Commit new datatype

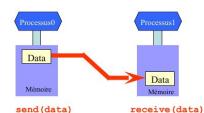

```
Commit new Data Type
```

```
MPI_Type_commit(MPI_datatype *datatype) ;
MPI_Type_free(MPI_datatype *datatype) ;
```

Introduction to MPI Programming
MPI Concepts
MPI Data partition. Domain partition

MPI Programming

MPI Concepts : Communication

Communications features:

- Point to Point vs collective ;
- synchrone vs asynchrone;
- various modes :
 - standard,
 - buffered,
 - synchronous,
 - ready.

Introduction to MPI Programming
MPI Concepts
MPI, Data partition, Domain partition

MPI Programming

MPI Concepts: One to One

Standard

- data : buf, count, datatype
- source, dest : rank of send, recv MPI process (joker MPI_ANY_SOURCE)
- tag : message id (joker MPI_ANY_TAG)
- comm : MPI communicator
- status : MPI_Status object with message complementary info
- request : MPI_Request object to manage asynchrone communication

Introduction to MPI Programming
MPI Concepts
MPI, Data partition, Domain partition

MPI Programming

MPI Concepts: One to One

Asynchrone :

Asynchrone

```
MPI_Isend(...,int dest, int tag, MPI_Comm comm, MPI_Request* request); MPI_Irecv(...,int source, int tag, MPI_Comm comm, MPI_Request* request);
```

Synchrone :

Synchrone

```
MPI_Ssend(...,int dest, int tag, MPI_Comm comm);
MPI_Srecv(...,int source, int tag, MPI_Comm comm);
```

Introduction to MPI Programming MPI Concepts
MPI, Data partition, Domain partition

MPI Programming

MPI Concepts: One to One

Ready :

Ready

```
\begin{aligned} & \mathsf{MPI\_Rsend}(\dots, \mathsf{int} \ \mathsf{dest}, \ \mathsf{int} \ \mathsf{tag}, \ \mathsf{MPI\_Comm} \ \mathsf{comm}) \ ; \\ & \mathsf{MPI\_Rrecv}(\dots, \mathsf{int} \ \mathsf{source}, \ \mathsf{int} \ \mathsf{tag}, \ \mathsf{MPI\_Comm} \ \mathsf{comm}) \ ; \end{aligned}
```

Buffered :

Buffered

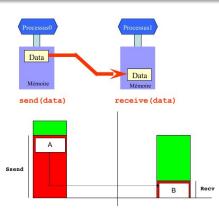

```
MPI_Bsend(...,int dest, int tag, MPI_Comm comm);
MPI_Brecv(...,int source, int tag, MPI_Comm comm);
```

Introduction to MPI Programming MPI Concepts

MPI Programming

MPI Concepts: One to One

Introduction to MPI Programming
MPI Concepts
MPI, Data partition, Domain partition

MPI Programming

MPI Concepts: Collective

Broadcast, Gather, Scatter, Alltoall;

Broadcast

- MPI_Bcast(void *buf, int count, MPI_Datatype datatype,
 int root, MPI_Comm com);
- MPI_Gather(void *sendbuf, int sendcount, MPI_Datatype sendatatype, void* recvbuf, int recvcount, MPI_Datatype sendatatype, int rout, MPI_Comm com);
- MPI_Scatter(void *sendbuf, int sendcount, MPI_Datatype sendatatype,
 void* recvbuf, int recvcount, MPI_Datatype sendatatype,
 int root,MPI Comm com);
- MPI_Alltoall(void *sendbuf, int sendcount, MPI_Datatype sendatatype, void* recvbuf, int recvcount, MPI_Datatype sendatatype, MPI_Comm com);

Introduction to MPI Programming
MPI Concepts
MPI, Data partition, Domain partition

MPI Programming

MPI Concepts: Collective

Reduction, (MPI_Op: MPI_MAX, MPI_MIN, MPI_SUM,...);

Reduce

MPI_reduce(void *sendbuf, void* recvbuf, int count, MPI_Datatype datatype, int root, MPI_OP op, MPI_Comm com);

MPI_allreduce(void *sendbuf, void* recvbuff, int count, MPI_Datatype datatype,

MPI_Op op, MPI_Comm com);

Barrier;

Barrier

int MPI Barrier(MPI Comm com);

Introduction to MPI Programming
MPI Concepts
MPI, Data partition, Domain partition

MPI Programming

Specific MPI Issues

- Deadlock management
 - standard send recv have behaviour implementation dependent
 - need to check communication scheme
 - otherwise use asynchronous mode
- Communication Overlap
 - it is possible to overlap communication with computation
 - require asynchronous mode;
 - postpone send or receive communication
 - require to manage communication buffer

Task Programming with TBB

Task Programming : other Runtime System Tool

Task programming since C++11

Generic concepts

Thread in C++

std::cout « "foo and bar completed.";

return 0;

Thread based Shared Memory Programming Model:

```
#include <iostream> // std::cout
#include <thread> // std::thread
void foo() {
    // do stuff...
    .}
    vid bar(int x) {
        // do stuff...
}
    int main() {
        std::thread first (foo); // spawn new thread that calls foo()
        std::thread first (foo); // spawn new thread that calls foo()
        std::thread second (bar,0); // spawn new thread that calls bar(0)
        // synchronize threads:
        first.join(); // pauses until first finishes
        second.join(); // pauses until second finishes
```

Task programming since C++11

Generic concepts

Synchronization: Critical section

- Mutex :
 - lock(), try lock()
 - unlock();
- Lock concepts :
 - lock a mutex on construction
 - release mutex on destruction

Introduction to Task Programming
Task Programming with since C++11
Task Programming with OpenMP
Task Programming with TBB
Task Programming: other Runtime System Tool

Task programming since C++11

Generic concepts

Critical section with mutex

```
#include <threat> // std::thread
#include <mutex> // std::mutex
std::mutex mix; // mutex for critical section
void doStuff (int n) {
    mt.lock();
    ...
    mt.unlock();
}
int main () {
    std::thread th1 (doStuff,50);
    std::thread th2 (doStuff,100);
    th1_join();
    th2_join();
    return 0;
```

Critical section with lock

```
#include <fractal // std::thread
#include <mutex> // std::mutex
std::mutex mix // mutex for critical section
void doStuff (int n) {
    std::lock_guard<std::mutex> lock(mtx);
    ...
    // automatic call destructor lock
}
int main () {
    std::thread th1 (doStuff,50);
    std::thread th2 (doStuff,100);
    th1_join();
    th2_join();
    return 0;
```

Task programming since C++11

Generic concepts

Atomic operations:

- template< class T > struct atomic;
- operator++, operator-;
- operator+=, operator-=;
- store(), load();
- exchange();
- compare_exchange_weak();
- compare_exchange_strong();

Introduction

OpenMP, Open Multi-Processing : standard for parallel programming on Shared Memory Architecture

- Thread based Shared Memory Programming Model
- directive based programming language
- portable
- C, C++, Fortran

History

- 1991 : Parallel Computing Forum defines a set of directives to parallelize Fortran Loops
- 1997 : OpenMP 1.0 standard for Fortran
- 1998 : standrad for CC++
- 2000 : OpenMP 2.0 standard for Fortran 1995
- 2008 : OpenMP 3.0 task concept
- 2013 : OpenMP 4.0 SIMD, accelerator
- 2017 : OpenMP 4.5 data mapping, doaccross,...

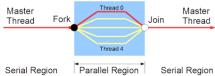

Principle

A standard API based on :

- directives (pragma interpreted at compile time)
- a library (dynamic functions executed at runtime)
- Environnement vatiables

Programming Model: Fork-Join Model

Memory Model: Shared Memory Model

- threads shared the main memory;
- each thread may manage a private memory

Introduction to Task Programming
Task Programming with since C++11
Task Programming with OpenMP
Task Programming with TBB
Task Programming: other Runtime System Too

OpenMP

Principle

Programming Model based on a Fork-Join Model: Master Thread Fork Thread 4 Serial Region Parallel Region Serial Region

Memory Model

based on a Shared Memory Model with threads

- threads shared the main memory;
- each thread may manage a private memory

Introduction to Task Programming
Task Programming with since C++11
Task Programming with OpenMP
Task Programming with TBB
Task Programming : other Runtime System Too

OpenMP

Directives

```
#pragma omp name [clause [clause] ...]

{
...
}
```

- name : directive name
- clause . . . : a liste of clauses
- the directive is applied to the following block

Introduction to Task Programming
Task Programming with since C++11
Task Programming with OpenMP
Task Programming with TBB
Task Programming: other Runtime System Too

OpenMP

PARALLEL REGIONS

```
PARALLEL REGIONS
```

```
#pragma omp parallel [clause [clause]...]
{
// PARALLEL REGION
}
```

- define a parallel region
- the current thread creates a team of threads
- the current thread becomes the master of the team
- the size of the team depends on (by prority order):
 - the clauses if,
 - the clause num_threads,
 - the function omp_set_num_threads()
 - the environment variable OMP NUM THREADS
- the following block is executed by the threads of the team

Task Programming: other Runtime System Tool

OpenMP

PARALLEL REGIONS

clause schedule

schedule (type[,chunk])

iteration distribution policy

- static: iterations divided in blocks of size chunk and assigned to threads in a round-robbin mode
- dynamic : thread ask dynamically block of size chunk
- runtime: defined at runtime with the environment variable OMP_SCHEDULE
- auto : policy defined at compile or runtime time

Data Scope Attribute Clauses

data-clause(list)

list: variable list

- private: list of variable in private memory (original variables are duplicated)
- firstprivate : like private automatic initialisation from original variable
- lastprivate : like provite automatic update og original variable
- **shared**: list of shared variables (not duplicated)
- default(shared|none) : default scope of all variables
- reduction(operator:list) :
- copyin(list): copy master variable value of list to other threads private copy
- copyprivate(list): brodcast variable value of list from single section to other threads copy

OpenMP

Synchronisation

Synchronization management:

- barrier: wait for all other team threads
- ordered : ensure that the following block respect sequential order
- critical: ensure that the following block be executed one thread at the same time
- atomic : ensure atomic operation on following variable
- master: ensure that the following block be executed only bay master thread
- locks

OpenMP

TASK since OpenMP 3

```
#pragma omp task [clause [clause]...]
{
// BLOCK
}
```

- the current thread creates a task with the following block
- the task is added to a pool of tasks

Clauses:

- if(expr): the task is executed by the current thread if expr=true
- final(expr): sub tasks ar integrated to the current task if expr=true
- untied : any thread can executed if task is suspended

Synchronization:

#pragma omp taskwait : define a barrier to wait that all sub tasks are

OpenMP

Runtime library

```
Library:
```

```
void omp_set num threads(int n)
void omp set dynamic(int bool)
void omp set nested(int bool)
void omp set max active levels(int n)
void omp set schedule(omp sched t type, int chunk)
int omp get num threads()
int omp get dynamic()
int omp get nested()
int ompget max active levels()
void omp get schedule(omp sched t* type, int* chunk)
int omp get thread num()
int omp get num procs()
int omp in parallel()
```

OpenMP¹

Environment variable

Environment variables:

Environment variables.				
OMP_NUM_THREADS	number of threads for parallel region			
OMP_SCHEDULE	define schedule policy			
OMP_DYNAMIC	true or false enable runtime adjust num of threads			
OMP_NESTED	true or false to activate nested parallelism			

Concurrency management

Two types of locks:

- omp_lock_t
- omp_nest_lock_t

Library functions:

void omp_init_lock(omp_lock_t* l)	initialize a lock l		
void omp_destroy_lock(omp_lock_t* l)	destroy the lock I		
void omp_set_lock(omp_lock_t* l)	lock the lock I		
void omp_unset_lock(omp_lock_t* l)	unlock the lock I		
void omp_test_lock(omp_lock_t* l)	try to lock I, return true if succeeded

Task Programming with TBB

Introduction to TBB

- Intel Threading Building Blocks
- enabling parallelism in C++ applications and libraries
- provides :
 - generic parallel algorithms,
 - concurrent containers,
 - support for dependency and data flow graphs,
 - thread local storage,
 - a work-stealing task scheduler for task based programming,
 - synchronization primitives,
 - a scalable memory allocator,
 - ..

Task Programming with OpenMP
Task Programming with TBB
Task Programming: other Runtime System Too

Task Programming with TBB

Principle: Block Range concepts

```
Range 2D
  using namespace tbb;
  parallel for(blocked range2d<int>(0,nrows,0,ncols),
           [&](blocked range2d<int> const r)
              for(auto i=r.rows().begin();i<r.rows().end();++i)
                for(auto i=r.cols().begin();i<r.cols().end();++i){
                  . . . ;
```

Introduction to Task Programming
Task Programming with since C++11
Task Programming with OpenMP
Task Programming with TBB
Task Programming: other Runtime System Tool

Task Programming with TBB

Principle

Serial containers

```
extern std::queue<T> MySerialQueue;
T item;
if( !MySerialQueue.empty() ) {
  item = MySerialQueue.front();
   MySerialQueue.pop_front();
   ... process item...
}
```

Concurrent containers

```
include "tbb/tbb.h"
using namespace tbb;
extern concurrent_queue<T>
MyQueue;
T item;
if( MyQueue.try_pop(item) ) {
    ...process item...
}
```

Task Programming with TBB

Principle

```
Task group
```

```
include "tbb/task group.h"
using namespace tbb;
int Fib(int n) \{ if( n<2 ) \{
   return n;
 } else {
   int x, y;
   task_group g;
   g.run([\&] \{x=Fib(n-1);\}); // spawn a task
    q.run([\&]{y=Fib(n-2);}); // spawn another task
    q.wait(); // wait for both tasks to complete
    return x+y;
```

Parallelism with SYCL

Vector Add operation

Vector Add example

```
#include <iostream>
#include <CL/sycl.hpp>
class vector addition;
int main(int, char**) {
  cl::sycl::float4 a = { 1.0, 2.0, 3.0, 4.0 };
  cl::sycl::float4 b = { 4.0, 3.0, 2.0, 1.0 };
  cl::sycl::float4 c = { 0.0, 0.0, 0.0, 0.0 };
  cl::sycl::default_selector device_selector;
  cl::sycl::queue queue(device selector);
    cl::sycl::buffer<cl::sycl::float4, 1> a sycl(a, cl::sycl::range<1>(1));
    cl::svcl::buffer<cl::svcl::float4, 1> b svcl(b, cl::svcl::range<1>(1));
    cl::sycl::buffer<cl::sycl::float4, 1> c_sycl(c, cl::sycl::range<1>(1));
     aueue.submit(
         [&] (cl::svcl::handler& cqh)
           auto a_acc = a_sycl.get_access<cl::sycl::access::mode::read>(cgh);
           auto b_acc = b_sycl.get_access<cl::sycl::access::mode::read>(cgh);
           auto c acc = c svcl.get access<cl::svcl::access::mode::discard write>(cgh);
           cgh.single_task<class vector_addition>(
              [=]()
                c_acc[0] = a_acc[0] + b_acc[0];
              });
         });
```

Parallelization with SYCL

Parallelism with SYCL

SYCL queues

SYCL Queues

cl::sycl::queue queue(default_selector);

//run on the CPU without runtime

cl::sycl::queue queue(host_selector);
// run on CPU with runtimr (e.g., OpenCL)

cl::sycl::queue queue(cpu_selector);

// run on GPU

cl::sycl::queue queue(gpu_selector);

//run on an FPGA or other accelerator

cl::sycl::queue queue(accelerator_selector);
